

Vulnerability Remediation PBQ - Answer Key

Correct Server to Patch Within 14 Days: 192.168.76.5

Correct Mitigation Technique: Patch; upgrade IIS to current release

Explanation:

- Server 192.168.76.5 has an unsupported Microsoft IIS version with CVSS 9.2.
- A CVSS score greater than 9.0 requires remediation within 7 days (critical severity).
- The PBQ asks for the server that must be patched within 14 days — this includes critical vulnerabilities.
- Upgrading IIS to the current supported release directly resolves the root cause.
- Other options (certificate fixes, MFA, ACL changes, exceptions) do not address unsupported software.
